## KING HIGHWAY LANDFILL POST-REMEDIATION INSPECTION FORM

### SOP M - Post-Remediation Inspection Procedures

| Inspection Date: _ | 6/8/2012       | Weather Conditions: | Sunny, 70's, light wind | Inspector(s): | M. Kohagen |  |
|--------------------|----------------|---------------------|-------------------------|---------------|------------|--|
| Time Arrived:      | 8:00 (AM) PM ) | Time Departed:      | 12:00 ( AM PM           |               |            |  |

| Inspection                                       | Condition |        |  | Comments/Proposed Action Items   | Photo  |
|--|-----------|--------|--|--|--------|
| Items  | Yes       | actory |  |  | No.    |
| Cover System                                     | 163       | 140    |  |  | 120151 |
| Settlement                                       |           | x      | Strip the soil, place and compact suitable soils within the depression, and replace excavated soil. Once the proper slope is restored, reseed the disturbed area |  |        |
| Water Ponding                                    | x         |        |  |  |        |
| Soil Erosion                                     | x         |        | Regrade or place additional appropriate materials in affected areas and promptly reseed to establish vegetative growth   | Unknown geotextile exposed in the southwest corner of the landfill, adjacent to the sedimentation basin. The location will be inspected to determine whether the geotextile material is a remnant from erosion and sediment control implementation during installation of the final cover system. Additional topsoil will be placed over the geotextile, and the area will be seeded to establish vegetative growth. |        |
| Slope Movement/                                  |           |        |  |  |        |
| Failure  | X         |        |  |  |        |
| Exposed FML                                      |           |        |  |  |        |
|  | ×         |        |  |  |        |
| Undesirable<br>Growth (Rooty<br>Trees or Shrubs) | x         |        |  |  |        |
| Protruding<br>Objects                            | x         |        |  |  |        |
| Burrowing<br>Animals                             |           | ×      | Regrade or place additional appropriate materials in the affected areas and promptly reseed to establish vegetative growth                                       | Several burrowing animal holes were observed at the landfill. None of the holes were observed in the final cover system. The holes will be filled and the areas seeded to establish vegetative growth. These areas will be monitored for additional holes generated by the burrowing animals.  | 3      |
| Cracks   |           |        |  |  |        |
|  | X         |        |  |  |        |
| Disturbance or<br>Loss of<br>Vegetation          |           | ×      |  | An approximate 20' by 20' area of stressed vegetation was observed on the north side of the landfill, south of the diversion berm. Previous soil gas sampling detected elevated methane concentrations within this area. A plan is being prepared to address possible liner failure, and will be submitted to MDEQ for review and approval by June 30, 2012.   | 2      |

| Condition of Locks  | ×                         |    |          |                                |  |

#### Notes

- 1. Evidence of differential settlement includes heaving around vent pipes and/or gas monitoring probes, leaning vent pipes and/or gas monitoring probes, and underground components of vent pipes and/or gas probes exposed above ground surface.
- 2. The locations where the inspection item photos were taken are provided on the attached figure.

#### **Additional Remarks:**

Several areas of stressed vegetation were observed on the cover system in addition to the original stressed vegetation area identified south of the diversion berm. Soil gas sampling was conducted within these other areas of stressed vegetation. No methane was detected within any of these other areas of stressed vegetation. The stressed vegetation is likely due to the very dry conditions at the landfill. These other areas of stressed vegetation will be addressed in the forthcoming work plan to be submitted to MDEQ by June 30, 2012. In addition, the purge water generated from recent groundwater sampling activities was treated and discharged to ground. Drew Santini (CDM Smith) was present for a portion of the landfill inspection.

Photo No. 1: Exposed geotextile located at the southwest corner of the landfill, adjacent to the sedimentation basin.

Photo No. 2: Area of stressed vegetation and possible settlement on the north side of the landfill, south of the diversion berm.

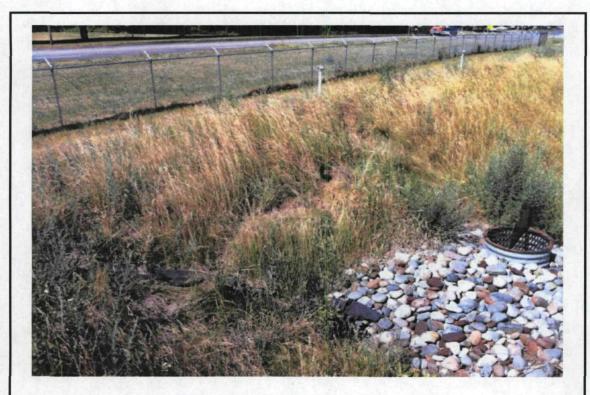

Photo No. 3: Location of observed animal hole adjacent to sedimentation basin outlet structure.

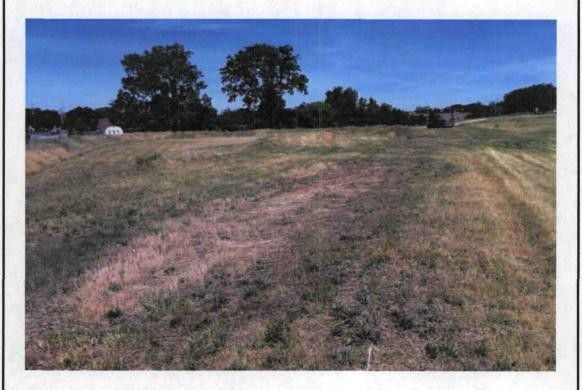

Photo No. 4: Area of stressed vegetation located outside the final cover system, east of the sedimentation basin.

Photo No. 5: North pore water discharge pipe outlet.
